

Serials Questions Predictive Check-In

1. Does your system have a predictive algorithm based not only on the defined pattern for the serial but also past experience in the receipt of issues for the serial?
2. Does your system accept manual input of received issue data when prediction is impossible or unreliable, or when gaps are filled?
3. Does your system support recording of receipt via scanning of the SISAC and/or UPC barcode?
4. Does your system have the ability to associate records of individual titles to membership records or other global records?
5. Does your system allow for expansion or collapse of check-in data?
6. Does your system support multiple types of check-in linked to the same record (i.e. one section received in full, one section received in part)?
7. Does your system allow for multiple routing procedures produced from the same record?
8. Does your system support electronic claiming as well as manual claiming?
9. Does your system make it possible to review and modify or override automatically generated claims before they are sent or transmitted?
10. Does your system support notes about the receipt, method of check-in and retention of special issues?
